

Portasilo *Mild Steel* Pressure Relief Valve

Portasilo have now re-launched their renowned pressure relief valve in *Mild Steel* to supplement the already successful stainless steel valve. The valve which until now was only available in Stainless Steel can now be purchased in its more cost effective Mild Steel form. The **PRV350** fully complies with the HSE guidelines (0-9540853-0-2) – Guidance to prevent over-pressurisation of storage silos during the delivery of powder.

Portasilo's **PRV350** combined pressure and vacuum relief valve is designed for protection of silos from damaging over and under pressures encountered during filling and emptying. The valve, which is capable of venting 13,000 m³/ hour in an over pressure situation has been fully tested and certified under controlled conditions witnessed by the HSE. The valve is now available in a lower cost *Mild Steel* version with a range of upstands and adapters available for new and retrofit applications. Both Stainless steel and Mild Steel PRV's are available with Portasilo's ground level testing (GLT).
