

SALORO BREAKS GROUND AT BARRUECOPARDO

It is pleasing to report that on site works have now accelerated at the Barruecopardo Tungsten project in Salamanca, Spain. The Barruecopardo Project is a low cost, simple mining and simple metallurgy tungsten project, located in the safe and stable location of Western Spain. The project, after commissioning towards the end of next year, will produce ~260,000 metric tonne units of WO₃, representing some 12% of current non-Chinese world tungsten concentrate supply.

Fairport Engineering, Saloro's Engineer, has been prominent in supporting these activities having previously undertaken the Basic Engineering studies for the project and is now advancing the ordering and manufacturing of proprietary equipment as well as defining the civil works associated with the processing plant and infrastructure. These civil works have recently been awarded and will commence in October 2017. Notwithstanding these on-site activities, Fairport continues to develop other aspects of the project including the mechanical and structural packages together with the electrical and control system areas.

For further information please contact Fairport Engineering's Communications Manager, Mrs Linda White (lwhite@fairport.co.uk).
